

ICEBERGS

Josep Ramos Herrada
&
Germi Guillamon Delgado

INTRODUCTION

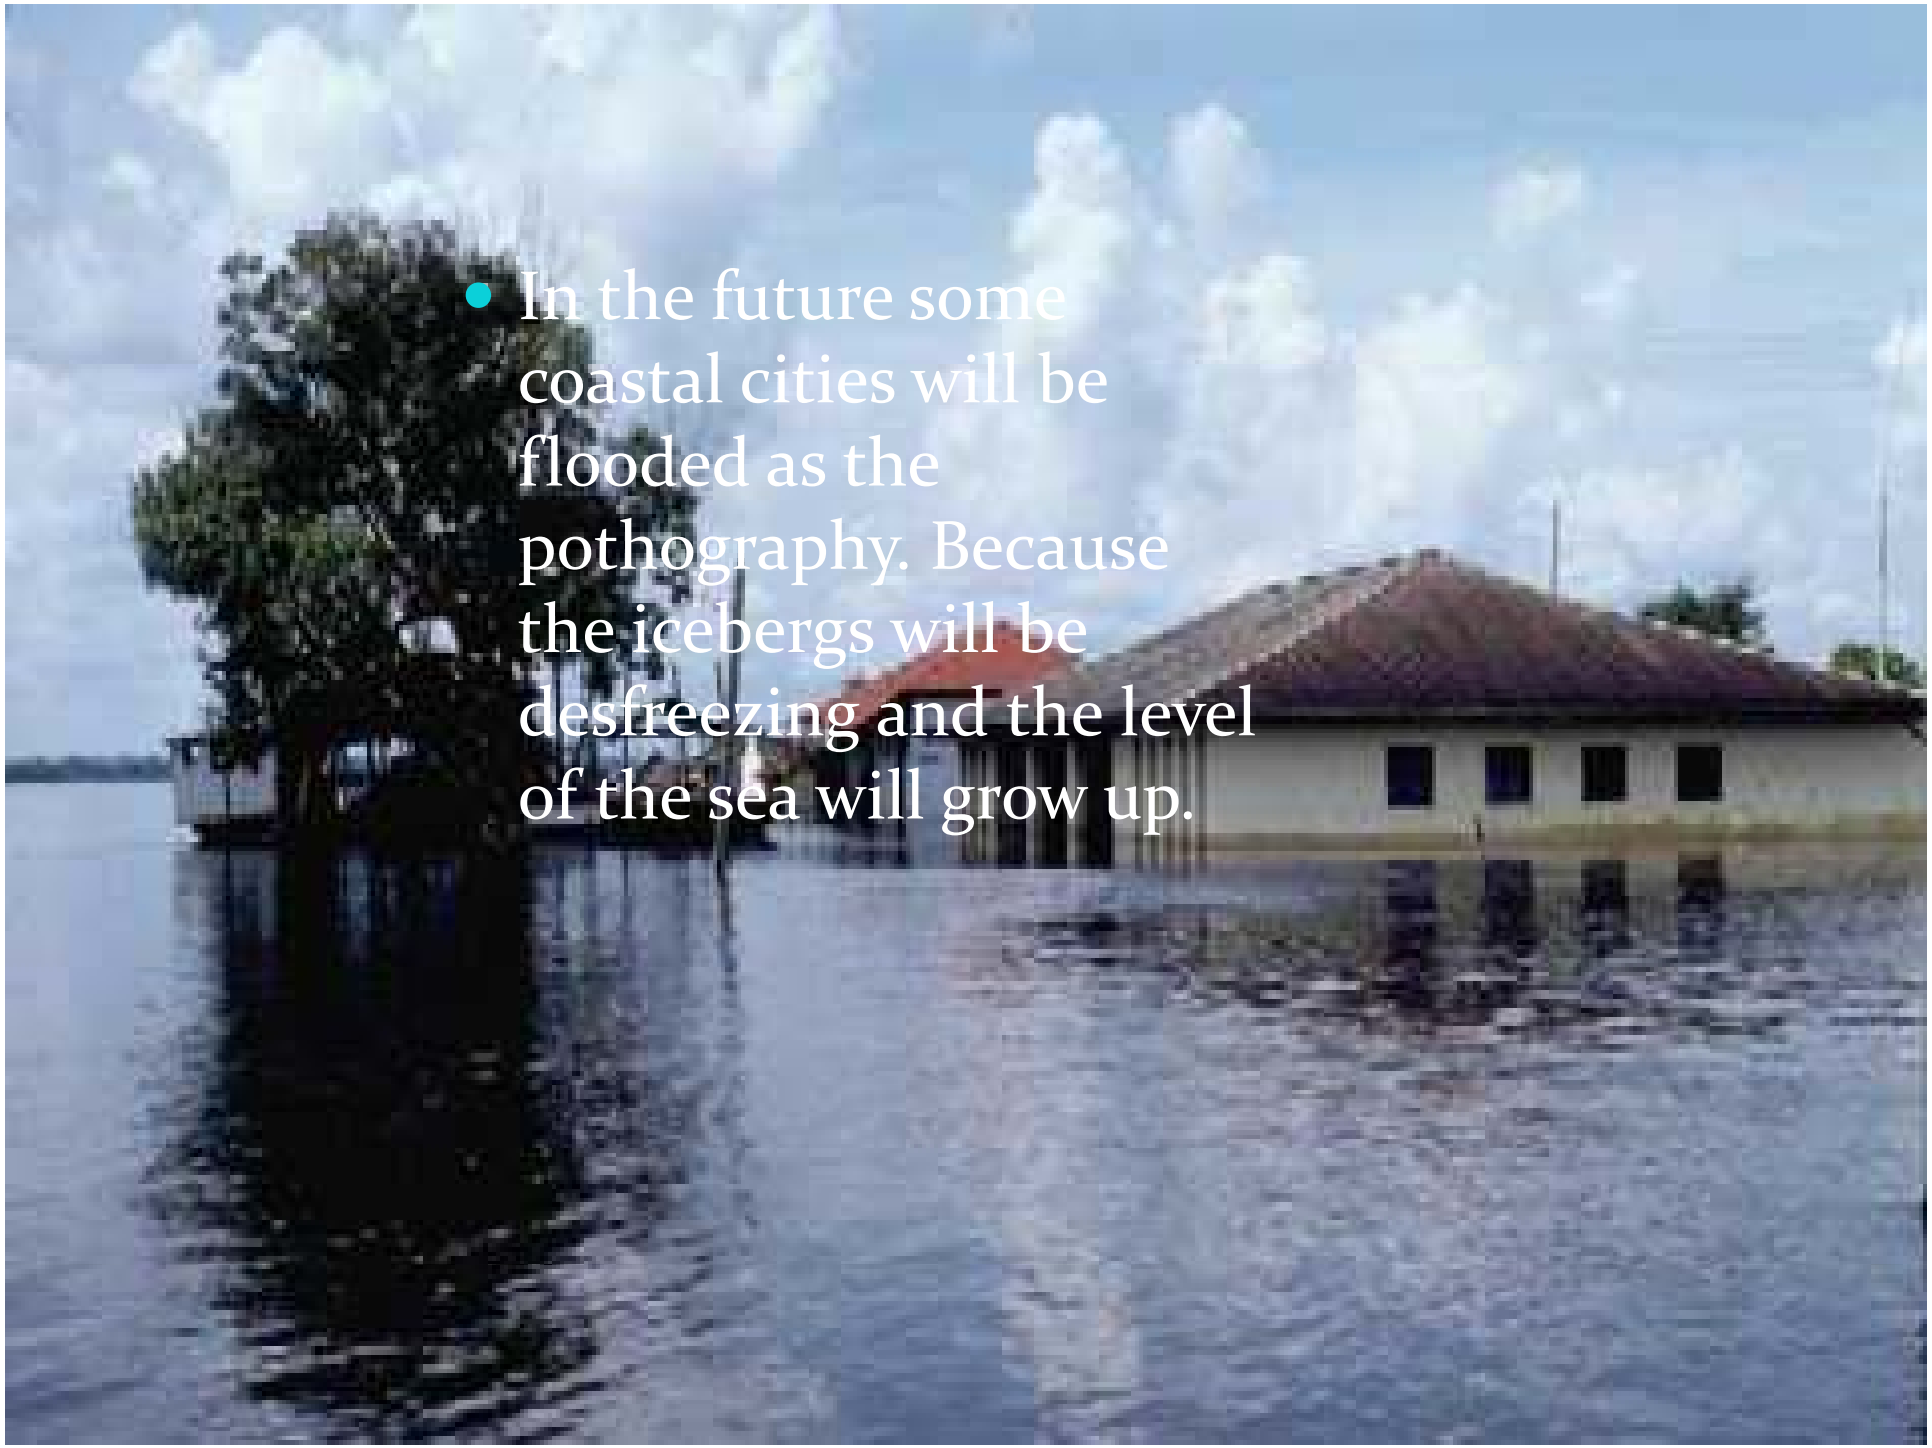

- Icebergs are related with global warming. Every day the Earth is hotter and icebergs are defreezing very fast. This is a problem for humankind because the level of the sea is very high and the cities of the coast are flooding.

- This is a problem for the animals their lives in the icebergs too. The icebergs are the house of these animals, if this problem continues this animals will be in danger of extinction.

- The Antartida is the place where there are more icebergs of the Earth in this moment. But the global warming continues…

... in the future this is what humankind will see if we don't stop global warming.

In the future some coastal cities will be flooded as the pothography. Because the icebergs will be desfreezing and the level of the sea will grow up.

This is an example of animal that will disappear, if the icebergs defreeze a lot of species of animals will be in danger of extinction (penguins, seals, bears...).

SOLUTIONS

- Stop the emision of CO_2 from USA and China, and sign the Kyoto protocol.
- Don't throw waste, brushes...) to the enviroment , because this affects the atmosphere.
- Use more renewable energies and eliminate the polution of contaminating energies.

- The day is near.
- What will you do?
